## 1 Introduction

This package was initiated to integrate some C/Fortran/SAS programs I have written or used over the years. As such, it would rather be a long-term project, but an immediate benefit would be something complementary to other packages currently available from CRAN, e.g. **genetics**, **hwde**, etc. I hope eventually this will be part of a bigger effort to fulfill most of the requirements foreseen by many, e.g. Guo and Lange (2000), within the portable environment of R for data management, analysis, graphics and object-oriented programming. My view has been outlined more formally in Zhao and Tan (2006a) and Zhao and Tan (2006b) in relation to other package systems. Also reported are Zhao (2005) and Zhao (2006) on package **kinship**.

The number of functions are quite limited and experimental, but I already feel the enormous advantage by shifting to R and would like sooner rather than later to share my work with others. I will not claim this work as exclusively done by me, but would like to invite others to join me and enlarge the collections and improve them.

## 2 Implementation

The following list shows the data and functions currently available.

#### \* ANALYSIS \*

AE3 AE model using nuclear family trios

bt Bradley-Terry model for contingency table cosize Power and sample size for case-cohort design

fbsize Sample size for family-based linkage and association design

gc.em Gene counting for haplotype analysis

gcontrol genomic control

geontrol2 genomic control based on p values

gcp Permutation tests using GENECOUNTING

genecounting Gene counting for haplotype analysis

gif Kinship coefficient and genetic index of familiality grmMCMC Mixed modeling with genetic relationship matrices

hap Haplotype reconstruction

hap.em Gene counting for haplotype analysis

hap.score Score statistics for association of traits with haplotypes

htr Haplotype trend regression

hwe Hardy-Weinberg equilibrium test for a multiallelic marker

hwe.cc A likelihood ratio test of population Hardy-Weinberg equilibrium

hwe.hardy Hardy-Weinberg equilibrium test using MCMC

kin.morgan kinship matrix for simple pedigree

LD22 LD statistics for two diallelic markers

LDkl LD statistics for two multiallelic markers

masize Sample size calculation for mediation analysis

mia multiple imputation analysis for hap

mtdt Transmission/disequilibrium test of a multiallelic marker mtdt2 Transmission/disequilibrium test of a multiallelic marker

by Bradley-Terry model

mvmeta Multivariate meta-analysis based on generalized least squares

pbsize Power for population-based association design pbsize2 Power for case-control association design pfc Probability of familial clustering of disease pfc.sim Probability of familial clustering of disease pgc Preparing weight for GENECOUNTING

print.hap.score Print a hap.score object s2k Statistics for 2 by K table

tscc Power calculation for two-stage case-control design

#### \* GRAPHICS \*

asplot Regional association plot

ESplot Effect-size plot mhtplot Manhattan plot

mhtplot2 Manhattan plot with annotations pedtodot Converting pedigree(s) to dot file(s)

plot.hap.score Plot haplotype frequencies versus haplotype score statistics

qqfun Quantile-comparison plots

qqunif Q-Q plot for uniformly distributed random variable

#### \* DATASETS \*

PD A study of Parkinson's disease and APOE, LRRK2, SNCA makers

aldh2 ALDH2 markers and alcoholism

apoeapoc APOE/APOC1 markers and schizophrenia

cf Cystic Fibrosis data crohn Crohn's disease data fa Friedreich ataxia data

fsnps A case-control data involving four SNPs with missing genotype

hla HLA markers and schizophrenia l51 An example pedigree data lukas An example pedigree

mao A study of Parkinson's disease and MAO gene

meyer A pedigree data on 282 animals deriving from two generations nep499 A study of Alzheimer's disease with eight SNPs and APOE

#### \* UTILITIES \*

SNP Functions for single nucleotide polymorphisms (SNPs)

BFDP Bayesian false-discovery probability FPRP False-positive report probability

ab Test/Power calculation for mediating effect

b2r Obtain correlation coefficients and their variance-covariances

chow.test Chow's test for heterogeneity in two regressions

comp.score score statistics for testing genetic linkage of quantitative trait

h2 Heritability estimation according to twin correlations

for case-control studies

klem Haplotype frequency estimation based on a genotype table

of two multiallelic markers

makeped A function to prepare pedigrees in post-MAKEPED format

metap Meta-analysis of p values

metareg Fixed and random effects model for meta-analysis

muvar Means and variances under 1- and 2- locus (diallelic) QTL model

read.ms.output A utility function to read ms output

twinan90 Classic twin models

whscore Whittemore-Halpern scores for allele-sharing

GRM functions ReadGRM, ReadGRMBin, ReadGRMPLINK, ReadGRMPCA, WriteGRM, Write

handle genomic relationship matrix involving other software

heritability functions h2G, VR, h2GC, h2l give point estimates as with their variances

for continuous traits and binary traits under liability threshold model and

case-control sampling

Assuming proper installation, you will be able to obtain the list by typing library(help=gap) or view the list within a web browser via help.start(). Assuming that you have already loaded the package via library(gap), you can use lsf.str("package:gap") and data(package="gap") to generate a list of functions and a list of datasets, respectively. If this looks odd to you, you might try search() within R to examine what is available in your environment before issuing the lsf.str command.

```
AE3 : function (model, random, data, seed = 1234, n.sim = 50000, verbose = TRUE)

A PDF version of this file can be viewed with command vignette("gap",package="gap").

You can cut and paste examples at end of each function's documentation.

Both genecounting and hap are able to handle SNPs and multiallelic markers, with the former be flexible enough to include features such as X-linked data and the later being able to handle large number of SNPs. But they are unable to recode allele labels automatically, so functions gc.em and hap.em are in haplo.em format and used by a modified function hap.score in association testing.

It is notable that multilocus data are handled differently from that in **hwde** and elegant definitions of basic genetic data can be found in the **genetics** package.

Incidentally, I found my C mixed-radixed sorting routine as in Zhao and Sham (2003) is much faster than R's internal function.

With exceptions such as function pfc which is very computer-intensive, most functions in the package can easily be adapted for analysis of large datasets involving either SNPs or multial-lelic markers. Some are utility functions, e.g. muvar and whscore, which will be part of the other analysis routines in the future.

The benefit with R compared to standalone programs is that for users, all functions have unified format. For developers, it is able to incorporate their C/C++ programs more easily and avoid repetitive work such as preparing own routines for matrix algebra and linear models. Further advantage can be taken from packages in **Bioconductor**, which are designed and written to deal with large number of genes.

## 3 Independent programs

To facilitate comparisons and individual preferences, I have made the source codes available for 2LD, EHPLUS, GENECOUNTING, HAP which have enjoyed great popularity ahead of the genomewide association studies (GWAS) therefore are likely to be more familiar than their R couunterparts in gap. However, you need to follow their instructions to compile for a particular computer system.

I have included ms code (which is required by read.ms.output) and .xls files to accompany read.ms.output and FPRP and BFDP functions as with a classic twin example for ACE model in **OpenMx**. The package is now available from CRAN and earlier it can be installed with command,

```
source('http://openmx.psyc.virginia.edu/getOpenMx.R')
```

For these models it is actually simpler to use facilities as in package **mets**, which I now suggest.

A final category is twinan90, which is now dropped from the package function list due to difficulty to keep up with the requirements by the R environment but nevertheless you will still be able to compile and use otherwise.

### 4 Demos

You can also try several simple examples via demo:

```
library(gap)
demo(gap)
```

## 5 Examples

I would like to highlight *pedtodot pbsize*, *fbsize* and *ccsize* functions used for pedigree drawing and power/sample calculations in a genome-wide association study as reported in Zhao (2007).

#### 5.1 Pedigree drawing

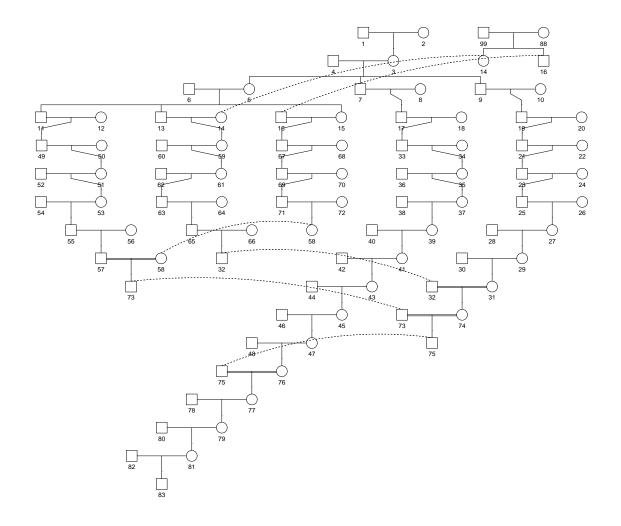

I have included the original file for the *R News* as well as put examples in separate vignettes. They can be accessed via vignette("rnews",package="gap") and vignette("pedtodot", package="gap"), respectively.

### 5.2 Kinship calculation

Next, I will provide an example for kinship calculation using *kin.morgan*. It is recommended that individuals in a pedigree are ordered so that parents always precede their children. In this regard, package **pedigree** can be used, and package **kinship2** can be used to produce pedigree diagram as with kinship matrix.

### Pedigree diagram

The pedigree diagram is as follows,

## Kinship calculation

We then turn to the kinship calculation.

- > # unordered individuals
- > library(gap)
- > gk1 <- kin.morgan(lukas)</pre>
- > write.table(gk1\$kin.matrix,"results/gap\_1.txt",quote=FALSE)
- > library(kinship2)
- > kk1 <- kinship(lukas[,1],lukas[,2],lukas[,3])</pre>
- > write.table(kk1, "results/kinship\_1.txt", quote=FALSE)
- > d <- gk1\$kin.matrix-kk1</pre>
- > sum(abs(d))

#### [1] 2.443634

- > # order individuals so that parents precede their children
- > library(pedigree)

```
> op <- orderPed(lukas)
> olukas <- lukas[order(op),]
> gk2 <- kin.morgan(olukas)
> write.table(olukas,"olukas.csv",quote=FALSE)
> write.table(gk2$kin.matrix,"results/gap_2.txt",quote=FALSE)
> kk2 <- kinship(olukas[,1],olukas[,2],olukas[,3])
> write.table(kk2,"results/kinship_2.txt",quote=FALSE)
> z <- gk2$kin.matrix-kk2
> sum(abs(z))
[1] 0
```

We see that in the second case, the result agrees with **kinship2**.

#### 5.3 Study design

#### Family-based design

The example involving family-based design is as follows,

```
> library(gap)
> models <- matrix(c(</pre>
           4.0, 0.01,
           4.0, 0.10,
           4.0, 0.50,
           4.0, 0.80,
           2.0, 0.01,
           2.0, 0.10,
           2.0, 0.50,
           2.0, 0.80,
           1.5, 0.01,
           1.5, 0.10,
           1.5, 0.50,
           1.5, 0.80), ncol=2, byrow=TRUE)
> outfile <- "fbsize.txt"
> cat("gamma", "p", "Y", "N_asp", "P_A", "H1", "N_tdt", "H2", "N_asp/tdt", "L_o", "L_s\n",
      file=outfile,sep="\t")
> for(i in 1:12) {
      g <- models[i,1]
      p \leftarrow models[i,2]
      z \leftarrow fbsize(g,p)
      cat(z$gamma,z$p,z$y,z$n1,z$pA,z$h1,z$n2,z$h2,z$n3,z$lambdao,z$lambdas,
          file=outfile,append=TRUE,sep="\t")
      cat("\n",file=outfile,append=TRUE)
+ }
> table1 <- read.table(outfile,header=TRUE,sep="\t")
> nc <- c(4,7,9)
> table1[,nc] <- ceiling(table1[,nc])</pre>
```

```
> dc <- c(3,5,6,8,10,11)
> table1[,dc] <- round(table1[,dc],2)</pre>
> unlink(outfile)
> # APOE-4, Scott WK, Pericak-Vance, MA & Haines JL
> # Genetic analysis of complex diseases 1327
> g <- 4.5
> p <- 0.15
> cat("\nAlzheimer's:\n\n")
Alzheimer's:
> fbsize(g,p)

#### Population-based design

The example involving population-based design is as follows,

```
> library(gap)
> kp <- c(0.01, 0.05, 0.10, 0.2)
> models <- matrix(c(</pre>
             4.0, 0.01,
             4.0, 0.10,
             4.0, 0.50,
             4.0, 0.80,
             2.0, 0.01,
             2.0, 0.10,
             2.0, 0.50,
             2.0, 0.80,
             1.5, 0.01,
             1.5, 0.10,
             1.5, 0.50,
             1.5, 0.80), ncol=2, byrow=TRUE)
> outfile <- "pbsize.txt"</pre>
> cat("gamma","p","p1","p5","p10","p20\n",sep="\t",file=outfile)
> for(i in 1:dim(models)[1])
     g <- models[i,1]
     p \leftarrow models[i,2]
     n <- vector()</pre>
     for(k in kp) n <- c(n,ceiling(pbsize(k,g,p)))</pre>
     cat(models[i,1:2],n,sep="\t",file=outfile,append=TRUE)
     cat("\n",file=outfile,append=TRUE)
+ }
> table5 <- read.table(outfile,header=TRUE,sep="\t")</pre>
> table5
```

#### 5.4 Graphics examples

I now include some figures from the documentation that may be of interest.

#### Genome-wide association

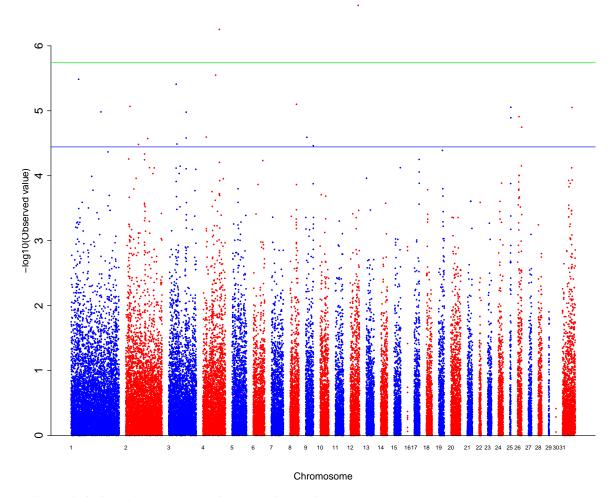

The following code is used to obtain a Q-Q plot via qqunif function,

Based on a chicken genome scan data, the code below generates a Manhattan plot, demonstrating the use of gaps to separate chromosomes.

```
> library(gap)
> load("4w.rda")
> ord <- with(d,order(chr,pos))</pre>
> d <- d[ord,]
> pdf("figures/4w.pdf",height=9,width=10)
> oldpar <- par()</pre>
> par(cex=0.6)
> colors <- c(rep(c("blue", "red"), 15), "red")</pre>
> mhtplot(d,control=mht.control(colors=colors,gap=1000),pch=19,srt=0)

#### Manhattan plot with genes highlighted

All these look familiar, so revised form of the function called **mhtplot2** was created for additional features such as centering the chromosome ticks, allowing for more sophisticated coloring schemes, using prespecified fonts, etc. Please refer to the function's documentation example.

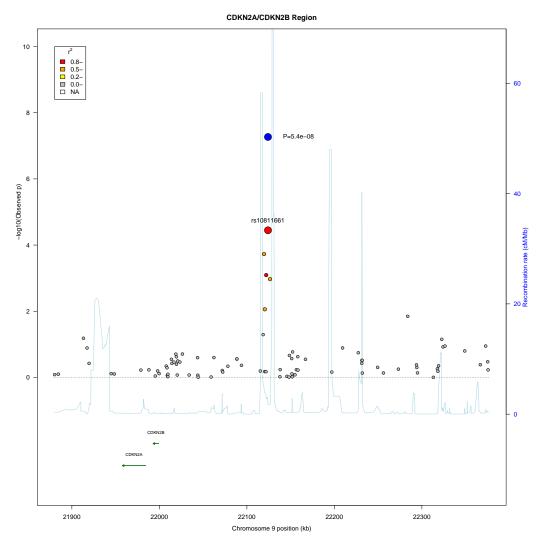

The code below obtains a regional association plot with the asplot function,

```
> library(gap)
```

- > pdf("figures/asplot.pdf",height=14,width=14)
- > asplot(CDKNlocus, CDKNmap, CDKNgenes, best.pval=5.4e-8, sf=c(3,6))
- CDKN2A
- CDKN2B
- > title("CDKN2A/CDKN2B Region")
- > dev.off()

null device

1

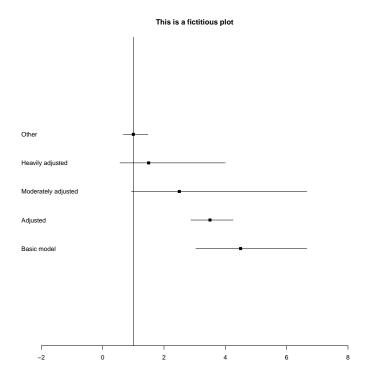

The function predates the currently popular **locuszoom** software but leaves the option open for generating such plots on the fly and locally.

### Effect size plot

The code below obtains an effect size plot via the ESplot function.

null device

Note that all these can serve as templates to customize features of your own.

## 6 Polygenic modeling

In line with the recent surge of interest in the polygenic models, a separate vignette is available through vignette("h2",package="gap") demonstrating aspect of the models on heritability.

# 7 Known bugs

Unaware of any bug. However, better memory management is expected.

# 8 Summary

I believe by now the package should have given you a flavour of initiatives I have made so far in relation to how the project was envisaged. More importantly, it is clear that availability of the package will serve as a platform on which future work can be accumulated and collaboration can be built.
